AI Usage Log - Xinlei Tian (Sprint 3)

Tool: Claude Code
Feature: Recruiter Dashboard and Posting Management

1. Acceptance Tests for Feature 1

- Prompt: "Write the acceptance tests for my Feature 1 and check whether any of them fail."
- AI output: Proposed acceptance criteria for US-17, US-18, US-19 and US-10, then wrote 9 Playwright tests in `dashboard.spec.ts` that create a test posting, have the test job seeker apply to it, and check the dashboard listing, application counts, access control, archiving and restoring, filtering by status and date, and status updates. The test posting has a description and is archived at the end, so it does not break the other tests, and the date filter test changes the application date only in the browser, so no fake data is written to the database.
- My review: Reviewed and approved the list of acceptance criteria before the AI wrote the tests, checking that each one matches a Feature 1 user story.
- Validation: The tests pass type checking and linting, and Playwright lists all 9 of them. They still have to be run in CI with the team's test accounts.
- Decision: Kept the tests. The existing CI pipeline runs them automatically on every push and pull request.

2. Debugging

- Failing CI test: Gave the AI the CI error for test AC-16.2 (empty job description). It compared my changes with the test and found that my code did not cause the failure: the newest open job in the shared database had no description, and the test reads the first job in the list. Decision: Fix the data instead of making the description required, since the description is optional in the job form.
- Database: The AI found that the database only allowed the statuses Open and Closed, so archiving (and saving drafts) would fail. It gave me a query to inspect the constraint and the SQL to allow Draft and Archived. Decision: I ran the SQL in Supabase myself, after the AI explained that it does not change any existing data.
- Testing setup: The AI found that the build and the tests failed locally because Playwright was missing from my installed packages, and that this was not a problem in my code. Decision: The AI installed the missing packages; no project files were changed.

Reflection: AI made writing the tests and finding the causes of failures faster. I checked its explanations against the code and the database before acting on them, and made the final decisions myself.
