Task 1.1: Define User Stories

Purpose of AI Use: Brainstorming and requirements elicitation

Chat Link or Prompt/Response:

Prompt: We are studying software process and we have a team project to design a web-based platform named CareerConnect which can help job seekers manage their job search activities. The system allows users to create profiles, upload and manage resumes, search for jobs, track their applications, and check the progress of applications. Our primary users are job seekers and recruiters. Could you generate 10 user stories for us?

Response: Absolutely. Here are 10 user stories for CareerConnect, covering both job seekers and recruiters. I've written them in the standard format:

As a [user], I want [goal], so that [benefit].

#	User Role	User Story
1	Job Seeker	As a job seeker, I want to create and update my profile, so that recruiters can learn about my skills, education, and experience.
2	Job Seeker	As a job seeker, I want to upload and manage multiple resumes, so that I can use the most appropriate resume for different job applications.
3	Job Seeker	As a job seeker, I want to search and filter job postings by keywords, location, salary, and job type, so that I can find relevant job opportunities efficiently.
4	Job Seeker	As a job seeker, I want to save interesting job postings, so that I can review and apply to them later.
5	Job Seeker	As a job seeker, I want to submit a job application through the platform, so that I can apply for positions without managing applications across multiple systems.
6	Job Seeker	As a job seeker, I want to track the status of my applications, so that I know whether an application is submitted, under review, shortlisted, rejected, or accepted.

7	Job Seeker	As a job seeker, I want to receive notifications when my application status changes, so that I can respond promptly to recruiters.
8	Recruiter	As a recruiter, I want to create and manage job postings, so that I can advertise available positions to qualified candidates.
9	Recruiter	As a recruiter, I want to view and search candidate profiles and resumes, so that I can identify candidates who match my job requirements.
10	Recruiter	As a recruiter, I want to update candidates' application statuses and provide relevant feedback, so that candidates can understand their progress in the recruitment process.

A useful way to group them

For your software-process project, you could organize these into epics:

● Profile & Resume Management: Stories 1–2

● Job Discovery & Applications: Stories 3–5

● Application Tracking: Stories 6–7

● Recruiter Management: Stories 8–10

These stories can also be expanded into acceptance criteria and then broken down into tasks for your team's sprint/backlog.

AI-Suggested Content: AI generated an initial list of 10 user stories covering the core functionality of CareerConnect. In these user stories, seven focused on job seekers, and three focused on recruiters. These stories covered user profile management, job application, tracking applications and recruiter management.

Validation: AI-generated user stories were compared with project requirements and reviewed during team brainstorming. Each user story was evaluated based on whether it matched the planned functionality of the platform.

Several user stories were modified:

User Story #2: "multiple resumes" was modified to managing individual resume because recruiters might be confused when they see multiple resumes on a user's

profile page.

User Story #3: The salary filter was removed because salary information on job search platform is often presented as broad ranges.

User Story #6: Shortlisted status was removed to simplify the application's status.

User Story #8: "qualified" was removed because job opportunities are displayed to users generally, while users can filter them according to their preferences.

User Story #9: "view and search candidate profiles and Resumes" was modified to "search for users based on their fields".

Decision: Modified and partially accepted.

Reflection: AI helped generate a start point for platform design and helped identify basic user stories needed for a job search website. However, the AI-generated user stories mainly focus on common features. Therefore, we conducted brainstorming to develop five original user stories to differentiate CareerConnect from existing job search websites.

Task 2.1: Generate Sample Jobs

Chat Link or Prompt/Response:

Prompt: type Job = { id: number; title: string; company: string; location: string; jobType: string; salary: string; description: string; postedAt: string; }; Could you generate five sample jobs for me using this format?

Response: Here are five sample jobs using your Job TypeScript format:

```
const sampleJobs: Job[] = [
  {
    id: 1,
    title: "Frontend Developer Intern",
    company: "TechNova Solutions",
    location: "Montreal, QC",
    jobType: "Internship",
```

```
    salary: "$22–$28/hour",
    description:
      "Develop responsive web applications using React, TypeScript, and CSS. Collaborate with designers and backend developers to improve user experience.",
    postedAt: "2026-10-20",
  },
  {
    id: 2,
    title: "Software Engineer",
    company: "MapleTech Inc.",
    location: "Toronto, ON",
    jobType: "Full-time",
    salary: "$85,000–$110,000/year",
    description:
      "Design, develop, and maintain scalable software applications. Write clean code, participate in code reviews, and work with cross-functional teams.",
    postedAt: "2026-10-18",
  },
  {
    id: 3,
    title: "UI/UX Designer",
    company: "Creative Pixel Studio",
    location: "Remote",
    jobType: "Contract",
    salary: "$40–$60/hour",
    description:
      "Create intuitive user interfaces and engaging user experiences. Develop wireframes, prototypes, and design systems using Figma.",
    postedAt: "2026-10-22",
  },
```

```
  {
    id: 4,
    title: "Data Analyst",
    company: "NorthStar Analytics",
    location: "Vancouver, BC",
    jobType: "Full-time",
    salary: "$70,000–$90,000/year",
    description:
      "Analyze business data, build dashboards, and generate actionable insights. Use SQL, Python, and data visualization tools to support decision-making.",
    postedAt: "2026-10-15",
  },
  {
    id: 5,
    title: "Marketing Assistant",
    company: "BrightPath Media",
    location: "Ottawa, ON",
    jobType: "Part-time",
    salary: "$20–$25/hour",
    description:
      "Assist with social media campaigns, create marketing content, track campaign performance, and support the marketing team with daily activities.",
    postedAt: "2026-10-24",
  },
];
```

These are fictional sample listings suitable for testing a job board application. You can use sampleJobs directly in your TypeScript project to populate job cards, test search and filtering, or build a job details page.

AI-Suggested Content: AI generated five sample job listings for CareerConnect using the required data format. The listings included job titles, company names,

locations, job types, salary ranges, descriptions, and posting dates. These sample jobs were used to test the website before connecting the database.

Validation: The generated sample jobs were reviewed to ensure they matched the data structure required by the CareerConnect website and could be used to test the job listing.

Decision: Accepted for temporary testing purpose.

Reflection: AI helped generate sample job data and made it easier to test the website before connecting the database. All generated sample jobs will be removed once the database is connected.

Task 3.1: Select Job Application Chart

Chat Link or Prompt/Response:

Link: https://chatgpt.com/c/6af13136-10e8-83e9-b8ab-0f1b7392b15d

AI-Suggested Content: AI provided two chart options and compared daily and monthly time ranges. It also suggested adding a time-range selector and summary statistics to the application dashboard.

Validation: The two chart options were compared based on readability and their suitability for displaying application activity over time. Finally, selected a line chart with a 30-day range to display daily job application activity.

Decision: Partially accepted.

Reflection: Comparing the two chart types helped me understand which visualization was more suitable for the job application dashboard. The 30-day line chart provides a clear view of recent application activity and makes it easier for users to track their progress.
